Rationalize MVPs

MVP#1: since our project's objective is to provide a service for users to rate and sort their music, which is different from other music web applications, our minimum viable product must have these two features at least and in order to do that we must have a signup/login page, a home screen with user's ratings and folders, and a search page that shows the titles of all the songs in our database. When a user clicks on a song title, they must be allowed to rate and add it to their folders at a minimum.

MVP#2: our second MVP details our nice to haves that would really make our project stand out for users. It would have all the features included in our option 1 listed in our business case. Users could not only rate and sort, but also review and get recommended songs based on their ratings. It would also help artists add their songs to the database for more exposure. This would be the next minimum viable project our group would work towards if the time frame and our coding abilities allows for it. Although we may not have time to fit these into our application, the added features would be very beneficial to users and we may have enough time to add at least one of our nice to have features.
